Adhesives used in this bamboo cabinet are emission free.

This cabinet is made of bamboo plywood, a truly a rapidly renewable resource.

Bamboo is the fastest growing “woody” plant on Earth and can grow more than a foot a day. The mother plant produces new shoots every year with stems maturing for harvest in 5 years. Oak, cherry, walnut and maple have cycles 10 to 15 times longer.

Ply bamboo is an alternative for cabinet, countertop and furniture construction, taking stains and finishes exceptionally well. Certain timber bamboos have greater tensile strengths than iron or steel.

DidYouKnow?

1/3 to 1/2 of the world’s 1,200 woody bamboo species may be in danger of extinction because so little forest habitat remains. Many specialized animal and bird species depend upon bamboos, and some of them are endangered. Learn where your bamboo originates.
