

Sun Block for Buildings

Office workers and homeowners desire natural light indoors, but not the heat or damaging ultraviolet rays.

Window shade screens:

- Filter the sunlight while providing a view to the outside.
- Control heat gain and loss, making the cooling and heating system of the building more energy efficient.
- Reduce the ultra-violet rays which cause furnishings to fade and age.
- Control light and glare which interfere with office tasks.

These shade screens are:

PVC Free.

PVC (Polyvinyl chloride) is harmful to human health and the environment due to dioxins and chloride that can be released from the material during manufacture, use and disposal.

Recycled and recyclable.

Made from 100% recycled polyester materials, the shades can be returned to the manufacturer, to be broken down into fibers and made into new shades.

DidYouKnow?

A “cradle to cradle” product is intended to be 100% recycled and recyclable, where it can be reclaimed and remade into new, first quality material, rather than “down cycled” into a product of lesser quality and wind up in a landfill.
